

# Medium-voltage surge arresters

# Surge arresters

## Definition

Surge arresters are used to protect electrical equipment, like transformers, circuit-breakers, and bushings, against the effects of overvoltages caused by incoming surges. Such overvoltages can be caused by a direct or nearby lightning strike, an electromagnetic pulse, electrostatic discharge, or switching operations in the power supply system as well as in devices. Some overvoltages are very high in energy. The current from the surge is diverted through the arrester, in most cases to earth. Effective overvoltage protection requires different surge arrester types to be used according to the particular application.

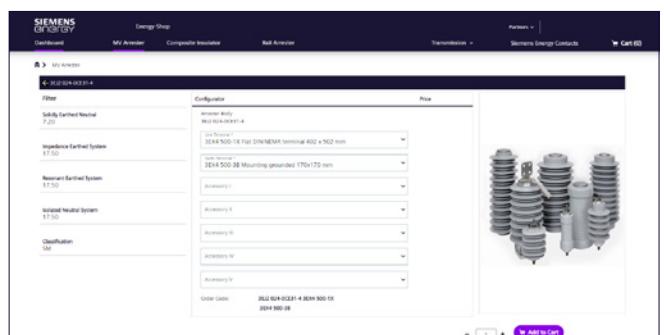

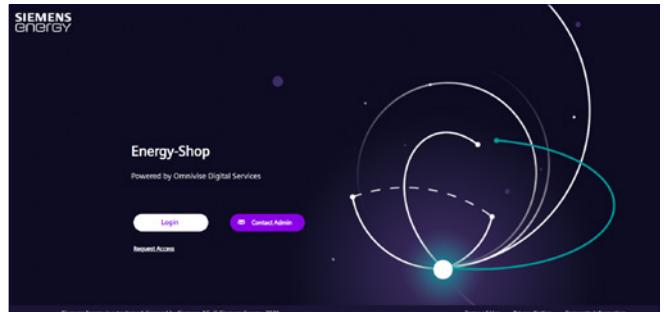

## The Energy-Shop

You have the possibility to purchase our surge arresters online, in our Energy Shop. There you can select your individual surge arrester and order directly.

# Siemens Energy surge arresters for any requirement

Experience is most essential when it comes to reliability in medium- and high-voltage applications. Siemens Energy has been designing and manufacturing medium- and high-voltage surge arresters for standard and special applications since 1925. Continuous research and development, the wealth of Siemens Energy know-how, and comprehensive worldwide experience give Siemens Energy surge arresters a leading edge in overvoltage protection. Their uncompromising quality ensures a long service life and reliability in any application.

Siemens Energy surge arresters are an indispensable aid to insulation coordination in electrical power supply systems. Valuable equipment such as transformers, circuit breakers, generators, motors, capacitors, traction vehicles and bushings, as well as complete switchgear, is optimally protected against lightning and switching overvoltages.

Siemens Energy surge arresters have been designed to meet the requirements of a wide range of common installation conditions, from arctic cold to the heat of the desert and the dampness of tropical climates. They are available for any application from 3 kV up to 1,200 kV including special applications such as high-voltage direct current (HVDC) and FACTS systems as well as all kinds of compensation systems for electric power networks.

## Siemens Energy offers a complete portfolio of surge arresters for all application areas and voltage levels

- High-voltage surge arresters for the protection of substation equipment for applications up to 1,200 kV
- Medium-voltage surge arresters for the protection of medium-voltage systems and components up to 72.5 kV
- Gas-insulated, metal-enclosed surge arresters for standard AC and DC applications from 72.5 kV to 800 kV
- Line surge arresters to improve network protection and to increase the reliability of the entire transmission system
- Surge arresters for railway applications for the protection of every part of a railway system

# Medium-voltage surge arresters

Siemens Energy provides a wide range of surge arrester product families for the protection of medium-voltage systems and components up to 72.5 kV. The selection of the surge arrester depends on the application to be protected:

## Distribution systems

Siemens Energy's **3EK** distribution class surge arrester product family is ideally suited for the reliable protection of transformers, circuit breakers, medium-voltage switchgear / panels and distribution lines.

## Surge arresters with high energy discharge capability

Next to the typical distribution class surge arresters, Siemens Energy offers the **3EJ Cage Design™** surge arrester product family with higher energy discharge capabilities in combination with a low protection level. The **3EJ surge arresters** protect rotating devices, like generators

and motors, arc furnaces, arc furnace transformers, industrial transformers, airfield-lighting systems, cable sheath, capacitors and capacitor banks and converters for drives.

## Special applications

For the overvoltage protection of generators and motors, which require a very high short-circuit current capability, Siemens Energy offers the **3EP-G** porcelain housed surge arresters with short-circuit current capability up to 300 kA.

The medium-voltage surge arresters are described in more detail in the next sections of this catalogue.

# MOVs:

## the core of Siemens Energy surge arresters

The main task of an arrester is to protect equipment from the effects of overvoltages. During normal operation, an arrester should have no negative effect on the power system. Moreover, the arrester must be able to withstand typical surges without incurring any damage. Nonlinear resistors fulfill these requirements thanks to the following properties:

- Low resistance during surges, so that overvoltages are limited
- High resistance during normal operation to avoid negative effects on the power system
- Sufficient energy discharge capability for stable operation

With this kind of nonlinear resistor, there is only a small flow of current when continuous operating voltage is being applied. When there are surges, however, excess energy

can quickly be removed from the power system by a high discharge current.

Nonlinear resistors made of metal oxide (MO) have proven especially suitable for this use. The nonlinearity of MO resistors is considerably high, which is why MO arresters do not need series gaps. Siemens Energy has many years of experience with gapless MO arresters in low-voltage systems, distribution systems, and transmission systems. Siemens Energy metal oxide resistors (MOVs) provide a high energy discharge capability providing a very low protection level. This means they absorb a high amount of energy while avoiding thermal runaways. The MOVs are characterized by their high long-duration current impulse withstand capability – an indirect measure of their single impulse energy discharge capability. Siemens Energy surge arresters are less prone to self-heating and consequent self-destruction, and they maintain their characteristics throughout their lifetime.

# Standards and testing

## Reliability you can count on

### Tests

Siemens Energy surge arresters have been designed and tested in compliance with the latest IEC 60099-4, IEEE C62.11, and GB 11032 standards. All type tests are performed by independent, PEHLA-certified laboratories; reports are available on request. Please contact your Siemens Energy representative for details.

Moreover, every single surge arrester that leaves the Siemens Energy factory undergoes a routine test and is delivered with a routine test certificate.

### Quality Assurance

Siemens Energy meets all requirements of ISO 9001:2008, ISO 14002:2004, and BS OHSAS 18001:2007. All Siemens Energy suppliers need to be certified according to ISO standards or will be audited by Siemens Energy.

To maintain sustainable quality improvement, Siemens Energy introduced corporate quality guidelines that contribute to each step of the quality process.

### Standardization

The aim of the IEC's Technical Committee 37 (TC 37) as well as the IEEE's Surge Protective Device Committee (SPDC) is the standardization of surge arrester testing and application. The TC 37 develops the standards IEC 60099-4, IEC 60099-8 (EGLA), IEC 60099-9 (HVDC), and the application guide IEC 60099-5, while the SPDC develops the standard IEEE C62.11 and the application guide IEEE C62.22. Both committees include representatives of manufacturers, utilities, test field labs, and universities.

Siemens Energy R&D experts are members of both bodies, thus playing an important role in the definition of the standards. They also share their expert knowledge in electrical power systems in CIGRE, the international council on large electric systems, which participates in the development of international standards.

Innovations in terms of arrester design and manufacturing processes are protected by a wide portfolio of Intellectual Property (IP) rights.

Deutsche  
Akkreditierungsstelle  
D-PL-12072-04-01

The test field is certified by the »Deutsche Akkreditierungsstelle« (Germany's national accreditation body) according to DIN EN ISOIEC 17025

UHV arrester prepared for testing in the HV test laboratory

# How to select a suitable surge arrester

This section describes the general approach to selecting typical arresters for overvoltage protection in medium-voltage systems. The requirements for a surge arrester emerge from two basic requirements: It should provide adequate protection with a sufficient safety margin, which means that overvoltages at the device to be protected must always remain below its withstand voltage. Furthermore, the surge arrester should be dimensioned for stable continuous operation, which means that the arrester must remain electrically and thermally stable under all conditions while handling all long-term, temporary, and transient stress resulting from network operation. These two requirements cannot be fulfilled independently. A reduction of the protective level automatically means a higher degree of specific electrical stress during continuous operation, and conversely, the continuous operating voltage of an arrester cannot be increased arbitrarily without raising its protective level as well. Both operating points are for a given type of MOV strictly associated with each other through the voltage-current (U-I) characteristic curve.

## Step 1:

### Selection of the continuous operating voltage and the rated voltage

The first step is to define the minimally required continuous operating voltage  $U_{c,min}$ . This must be as high as the continuous phase-to-earth voltage of the system. Here, »continuously« applied voltage means every voltage that occurs within an uninterrupted period of more than 30 minutes.

**The type of neutral earthing of the system is decisive in determining the continuous operating voltage.**

In isolated or resonant earthed neutral systems, the voltage of a healthy phase against ground takes on the value of the phase-to-phase voltage in the case of a one-phase earth fault (earth fault factor  $k = 1.73$ ). Since resonant earthed neutral systems are operated quite commonly for time periods of more than 30 minutes in this condition, the continuous operating voltage of the arrester must, in this case, have the value of the highest voltage of the system,  $U_s$ .

Solidly earthed neutral system:

$$U_{c,min} \geq U_s / \sqrt{3}$$

Isolated or resonant earthed neutral system:

$$U_{c,min} \geq U_s$$

Example for a 24 kV system, solid earthing:

$$U_s = 24 \text{ kV}$$

$$U_{c,min} = 13.9 \text{ kV}$$

$$U_{r,min} = 17.3 \text{ kV}$$

$$\text{Typical } U_r = 18 \text{ kV}$$

Example for a 24 kV system, isolated neutral:

$$U_s = 24 \text{ kV}$$

$$U_{c,min} = 24 \text{ kV}$$

$$U_{r,min} = 30 \text{ kV}$$

$$\text{Typical } U_r = 30 \text{ kV}$$

The definition of the minimally required continuous operating voltage, a factor which usually has a value of 1.25, helps achieve a rated voltage  $U_r = 1.25 \cdot U_{c,min}$ . This is the lowest necessary rated voltage of the arrester.

Table »Typical rated voltages  $U_r$  for highest voltages of the system  $U_s$ « on page 12 and 13 lists typically applied rated voltages.

## Step 2:

### Selection of the nominal discharge current $I_n$

The nominal discharge current  $I_n$  serves to classify a surge arrester. From a technical point of view, it is calculated from a typical maximum lightning current amplitude that can be expected in the substation, for which the insulation coordination is performed via the arrester's lightning protection level. This amplitude is calculated from the flashover voltage  $U_{fo}$  of the line insulators, the lightning protection level  $U_{pl}$  of the arresters, and the surge impedance  $Z$  of the line for  $I_{max}$ :

$$I_{max} = (2 \cdot U_{fo} - U_{pl}) / Z$$

Example for a 24 kV system:

$$U_{fo} = 250 \text{ kV}$$

$$U_{pl} = 80 \text{ kV}$$

$$Z = 450 \text{ Ohm}$$

$$I_{max} = 0.9 \text{ kA}$$

A 10 kA arrester, for instance, can readily withstand lightning current impulses of higher amplitudes without severe damage.

## Step 3:

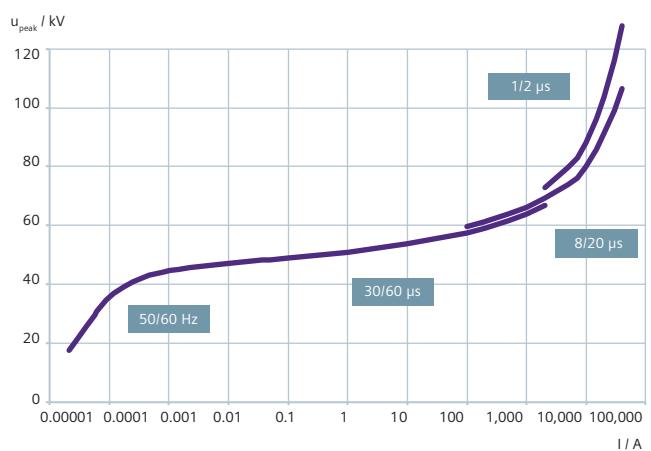

### Selection of protective levels

The protective characteristics of an arrester are most frequently assessed by means of its lightning impulse protective level: It is assessed according to its residual voltage while the nominal discharge current is flowing. This usually means that a protective level equaling the standard lightning impulse withstand voltage of the device to be protected and divided by a factor of 1.4 is adequate for protection against lightning overvoltages.

$$U_{pl, 10 \text{ kA}, 8/20\mu\text{s}} < \text{BIL} / 1.4$$

The selection of the electrical characteristics of the arrester is finished when the requirements regarding the protective levels of all mentioned current impulse stresses are fulfilled.

Example U-I-curve 30 kV arrester

## Step 4:

### Selection of the energy class

The application guide IEC 60099-5 to the standard IEC 60099-4 describes how the charge transfer and energy handling capability of a surge arrester can be determined. Surge arresters dissipate switching surges by absorbing energy. The charge transfer and amount of energy is related to the switching surge magnitude and wave shape, the system impedance, the arrester protective characteristics, and the number of switching operations.

The selected arrester should have charge and energy rating capability greater than the accumulated charge transferred and energy associated with the expected highest surges on the system.

The application guide IEC 60099-5 offers equations to estimate charge transfer and the energy handling capability requirements of surge arresters.

$$Q_s = (U_{rp} - U_{ps}) \times 2 \times L / c Z_s$$

$$W_s = U_{ps} \times Q_s$$

#### Where:

$U_{rp}$  is the representative maximum switching voltage (in kV)

$U_{ps}$  is the arrester residual voltage during the line discharge (in kV)

$L$  is the line length with surge travel at light speed  $c$

$c$  is the speed of light (300,000 km/s)

$Q_s$  is the cumulative charges transferred during single line switching (in Coulombs)

$W_s$  is the cumulative energy absorbed by the arrester during single line switching (in kJ/kV)

The application guide IEEE C62.22 offers equations to estimate the energy handling capability requirements of surge arresters. The energy discharged by an arrester  $J$  in kJ may be estimated by the equation:

$$J = 2D_L E_A I_A / v$$

#### Where:

$D_L$  is the line length (in kilometers)

$E_A$  is the arrester switching impulse discharge voltage (in kV) for  $I_A$

$I_A$  is the switching impulse current (in kA)

$v$  is the speed of light, 300,000 km/s

The equations assume that the entire line is charged to a prospective switching surge voltage (which exists at the arrester location) and is discharged through the arrester at its protective level during twice the travel time of the line. The single discharge voltage and current are related by the equation:

$$I_A = (E_s - E_A) / Z$$

#### Where:

$E_s$  is the prospective switching surge voltage (in kV)

$Z$  is the single-phase surge impedance of line (in ohms)

The table below shows the definition of the energy class according to standard IEEE C62.11. This energy is not a fixed value, but instead depends on the arrester's protective level. The higher the discharge voltage, the less energy the arrester absorbs during the line discharge, since the line will discharge less intensely when the discharge voltage is higher.

Energy class	A	B	C	D	E	F	G	H	J	K	L	M	N
Energy rating (Two shot) kJ/kV <sub>MCOV</sub>	3.0	4.5	6.0	7.5	9.0	11	13	15	18	21	24	27	30

## Step 5:

### Protective zone

The protection of the equipment by an arrester can be guaranteed only for short distances between arrester and equipment, due to travelling wave effects on the line. Rapidly increasing overvoltages spread in the form of traveling waves on the line. Refraction and reflection occur in places where the surge impedance of the line changes.

The maximum distance between surge arrester and equipment to be protected is described with following formula:

$$x_s = (BIL / 1.15 - U_{pl}) v_{tw} / 2s$$

Example for a 24 kV system, solid earthing:

$$U_s = 24 \text{ kV}$$

$$BIL = 125 \text{ kV}$$

$$U_{pl} = 47.7 \text{ kV}$$

$$x_s = 9.1 \text{ m}$$

Example for a 24 kV system, isolated neutral:

$$U_s = 24 \text{ kV}$$

$$BIL = 125 \text{ kV}$$

$$U_{pl} = 79.5 \text{ kV}$$

$$x_s = 4.4 \text{ m}$$

### Where:

$x_s$  protective zone (in m)

BIL basic insulation level of equipment (in kV)

$U_{pl}$  protection level of the arrester (in kV)

$s$  front steepness of incoming surge (in kV/μs)  
(in the range of 1000 kV/μs)

$v_{tw}$  propagation speed of travelling wave:  
300 m/μs (overhead line) (equals „c“)

# 3EK Distribution class surge arresters with silicone rubber housing

**Siemens Energy cage design and wrap design 3EK distribution class surge arresters offer superior protection against overvoltages in medium-voltage systems.**

A disconnector is a device at the earth terminal of the arrester, which separates the arrester from the system after an overloading. Without a disconnector – at least in a solidly earthed neutral system – a subsequent operation of the appropriate line section would no longer be possible. The disconnector is of great importance for a trouble-free operation of a distribution network.

Disconnectors are only used in distribution systems. One of the most common working principles of disconnectors is the ignition of a small explosive device (e.g., the cartridge of a gas pistol) caused by the thermal effect of the power-frequency earth fault current, which flows after an arrester failure. The explosive device tears the surrounding polymeric housing and causes the flexible earthing lead to disconnect from the arrester.

The metal oxide resistors (MOV) are enclosed by a cage made of fiber-reinforced plastic (FRP) rods, providing a rigid, reinforced structure ensuring high mechanical strength.

Reliability is guaranteed by the direct molding of the silicone rubber onto the MOVs and the FRP rods. This ensures the total embedding of all components free of inclusions and gaps, thus providing an excellent sealing system against moisture ingress, which avoids partial discharges.

In the extremely rare event of the MOVs being overloaded, arcing cannot result in a buildup of critical internal pres-

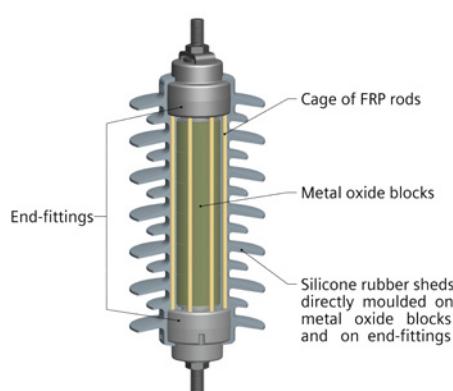

sure, since the MOVs are not enclosed in a sealed mechanical shell. The arc can escape directly through the soft silicone housing, leaving the mechanical support structure of the enclosure unharmed. The ejection of internal parts that could damage other equipment nearby is prevented almost completely. Siemens Energy' innovative cage design ensures outstanding performance in safety issues.

Silicone rubber is highly hydrophobic and maintains its ability to repel water and any deposits of pollution throughout its entire service life. This results in high tracking and erosion resistance. The silicone rubber housing is self-extinguishing and flame-retardant. These advantages provide maintenance-free and reliable service life for 3EK surge arresters.

Siemens Energy offers two product lines for the application in distribution networks:

- **3EK7** – for rated voltages up to 60 kV, very high mechanical performance.
- **3EK8** – for rated voltages up to 36 kV

The proven 3EK7 is also available in a version for indoor application, which is a cage design surge arrester offering the same benefits as the version for outdoor application.

Siemens Energy 3EK cage design surge arresters are ideally suited for the reliable protection of:

- Transformers
- Circuit breakers
- Medium-voltage switchgear / panels
- Distribution lines

## How to order

3EK7 IEEE

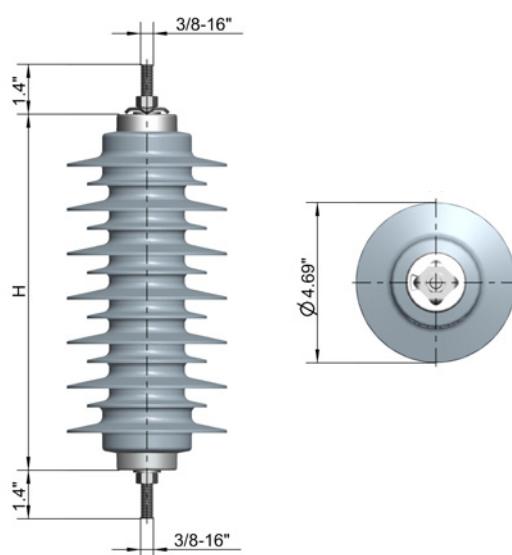

### Example 3EK7 360-3AH4

3EK7	... Medium-voltage surge arrester
360	... Rated voltage = 36 kV
3	... IEEE classification heavy duty
C	... IEEE
H	... Housing type (H=400 mm)
4	... Alternating sheds

### Example 3EK7 360-3AH4-Z M11 P12 M81

-Z	... is indicating accessories
<b>Accessories:</b>	
M11	... Line clamp (M=Line terminal)
P12	... NEMA insulating bracket (M=Ground terminal)
M81	... Bird protection cap

## How to order

3EK7 indoor IEC

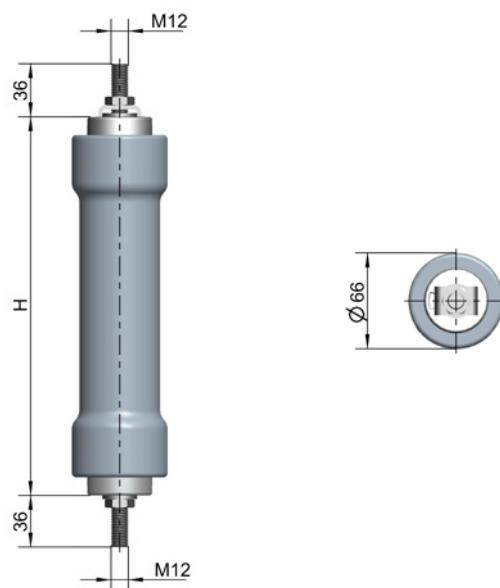

### Example 3EK7 360-4CHO

3EK7 ... Medium-voltage surge arrester  
 360 ... Rated voltage = 36 kV  
 4 ... LD class 1 [5 → LD class 2]  
 C ... IEC  
 H ... Housing type (H=400 mm)  
 0 ... Shedless

### Example 3EK7 360-4CHO-Z M11 P12 M81

-Z ... is indicating accessories  
**Accessories:**  
 M11 ... Line clamp (M=Line terminal)  
 M12 ... NEMA insulating bracket (M=Ground terminal)  
 M81 ... Bird protection cap

## How to order

3EK8 RP IEEE

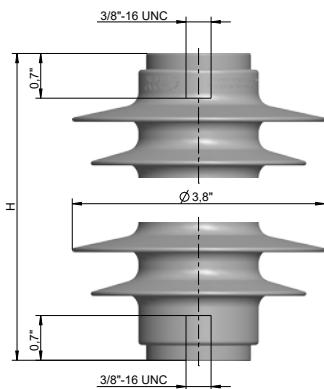

### Example 3EK8 360-3AJ4

3EK8	... Medium-voltage surge arrester
360	... Rated voltage = 36 kV
3	... IEEE classification heavy duty
A	... IEEE
J	... Housing type (H=322 mm)
4	... Alternating sheds

### Example 3EK8 360-3AJ4-Z M11 P12 M81

-Z	... is indicating accessories
<b>Accessoires:</b>	
M11	... Line clamp (M=Line terminal)
P12	... NEMA insulating bracket (M=Ground terminal)
M81	... Bird protection cap

## Dimensions 3EK8 RP IEEE

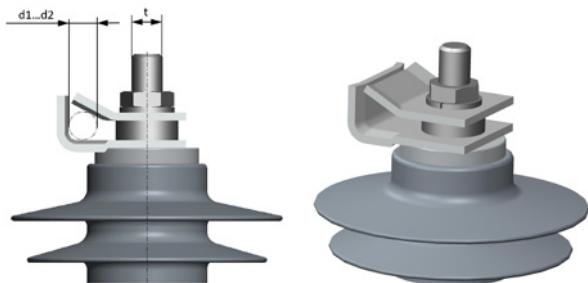

# 3EK Accessories

## Line terminal options

### [M11] Line Clamp ø8 mm ... ø18 mm

Order number spare part: for thread 3/8": 3EX4 063-0A / for thread M12: 3EX4 063-0C

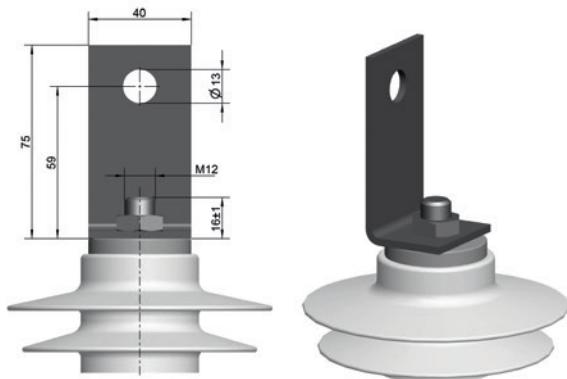

For surge arrester:

3EK7 and 3EK8

	IEC	IEEE
d1	8 mm	0.32"
d2	18 mm	0.70"
t	M12	3/8 - 16"

### [M12] L-bracket

Order number spare part: for thread M12: 3EX4 071

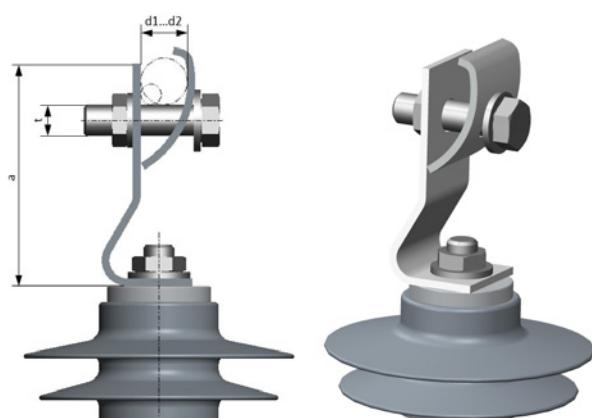

For surge arrester

3EK7 and 3EK8

	IEC	IEEE
a	59 mm	-
b	40 mm	-
h	75 mm	-
d1	13 mm	-

### [M13] Line clamp ø8 mm ... ø18 mm

Order number spare part: for thread 3/8": 3EX4 101-1A / for thread M12: 3EX4 101-1C

For surge arrester

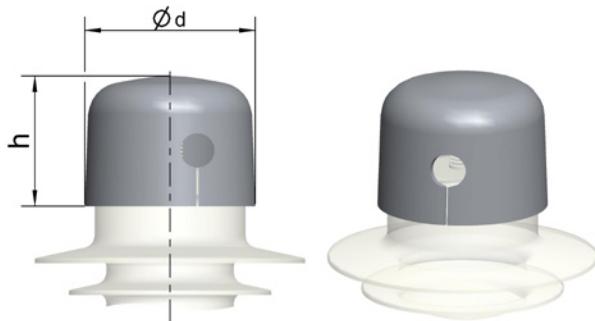

3EK7 and 3EK8

	IEC	IEEE
a	86 mm	3.39"
d1	8 mm	0.32"
d2	18 mm	0.70"
t	M 12	3/8 - 16"

## Bird protection cap options

### [M81] Bird protection cap

Order number spare part: 3EX4 128-0A

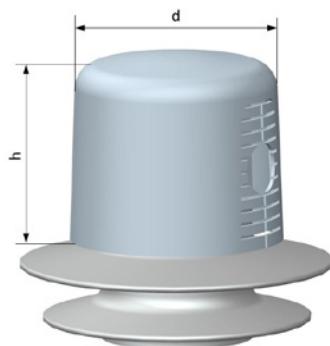

For surge arrester:

3EK7

	IEC	IEEE
d	75 mm	2.95"
h	57 mm	2.25"

### [M81] Bird protection cap

Order number spare part: 3EX4 068-0C

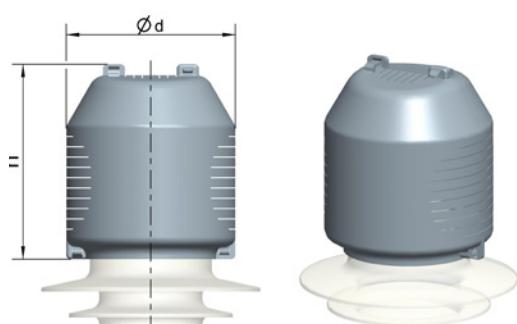

For surge arrester:

3EK8

	IEC	IEEE
d	65 mm	2.56"
h	57.2 mm	2.25"

### [M84] Bird protection cap XL

Order number spare part: 3EX4 103

For surge arrester:

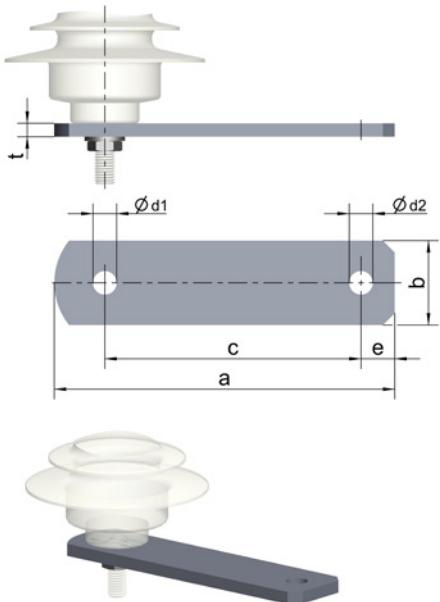

3EK7

	IEC	IEEE
d	92 mm	3.62"
h	106 mm	4.17"

## Metal bracket options

### [P11] NEMA metal bracket

Order number spare part: for thread 3/8": 3EX4 061-0A / for thread M12: 3EX4 061-0C

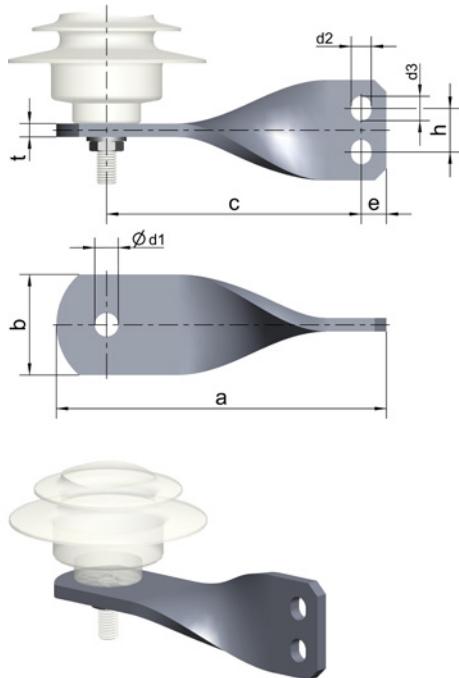

For surge arrester

3EK7 and 3EK8

	IEC	IEEE
a	202 mm	7.95"
b	50 mm	1.97"
c	152 mm	5.98"
e	20 mm	0.79"
d1	14 mm	0.55"
d2	14 mm	0.55"
t	8 mm	0.32"

**[P21] DIN metal bracket**

Order number spare part: 3EX4 062

For surge arrester

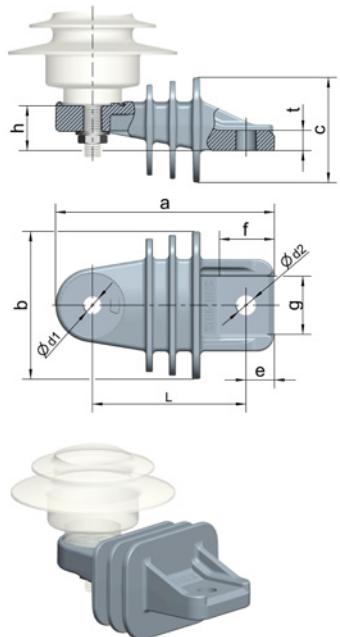

3EK7 and 3EK8

	IEC	IEEE
a	197 mm	7.76"
b	60 mm	2.36"
c	152 mm	5.98"
e	15 mm	0.59"
d1	14 mm	0.55"
d2	12 mm	0.47"
d3	14.5 mm	0.57"
h	26 mm	1.02"
t	8 mm	0.32"

## Insulating bracket options

### [P12] NEMA insulating bracket for $U_r \leq 15$ kV

Order number spare part: for thread 3/8": 3EX4 080-1A / for thread M12: 3EX4 080-1C

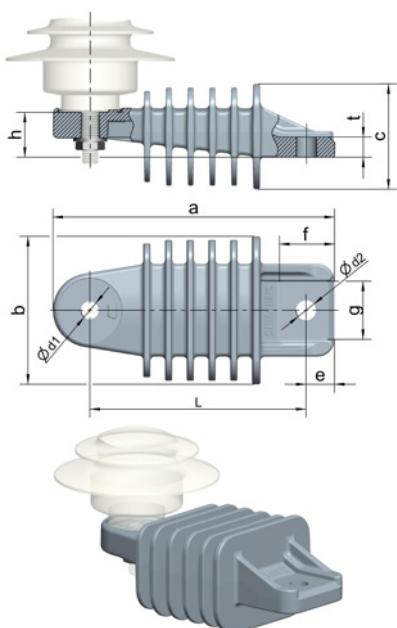

For surge arrester

3EK7

	IEC	IEEE
a	154 mm	6.06"
b	104 mm	4.1"
c	74 mm	2.91"
e	20 mm	0.79"
f	40 mm	1.58"
g	41 mm	1.61"
h	31,5 mm	1.24"
d1	12,5 mm	3/8"
d2	14 mm	1/2"
l	108 mm	4.25"
t	14,2 mm	0.56"

### [P12] NEMA insulating bracket for $U_r > 15$ kV

Order number spare part: for thread 3/8": 3EX4 080-2A / for thread M12: 3EX4 080-2C

For surge arrester

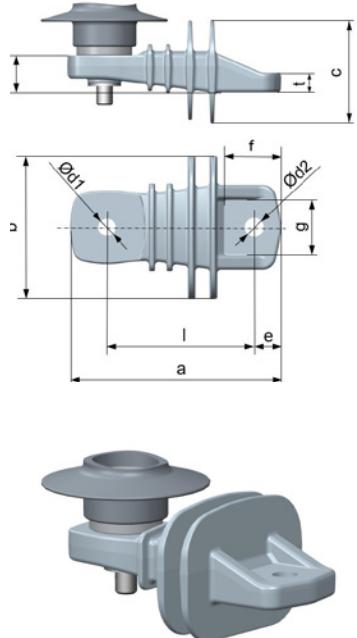

3EK7

	IEC	IEEE
a	198 mm	7.8"
b	104 mm	4.1"
c	74 mm	2.91"
e	20 mm	0.79"
f	40 mm	1.58"
g	41 mm	1.61"
h	31.5 mm	1.24"
d1	12.5 mm	3/8"
d2	14 mm	1/2"
l	15.2 mm	6.0"
t	14.2 mm	0.56"

## Insulating bracket options

### [P12] NEMA insulating bracket for $U_r \leq 15$ kV

Order number spare part: for thread 3/8": 3EX4 120-1A / for thread M12: 3EX4 120-1C

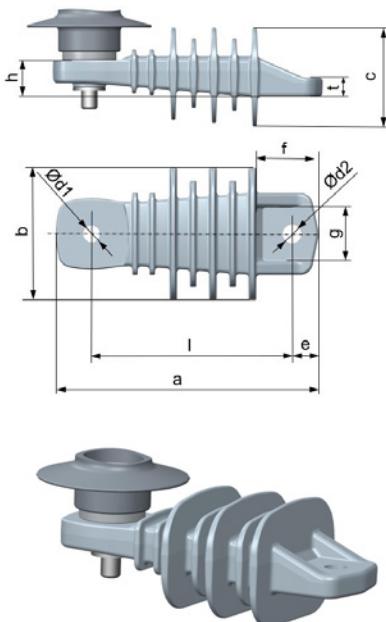

For surge arrester

3EK8

	IEC	IEEE
a	155 mm	6.1"
b	104 mm	4.09"
c	73.8 mm	2.9"
e	19.8 mm	0.78"
f	41 mm	1.61"
g	41 mm	1.61"
h	27 mm	1.06"
d1	10.5 mm	3/8"
d2	14 mm	1/2"
l	108 mm	4.25"

### [P12] NEMA insulating bracket for $U_r > 15$ kV

Order number spare part: for thread 3/8": 3EX4 120-2A / for thread M12: 3EX4 120-2C

For surge arrester

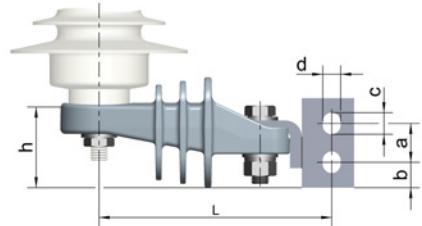

3EK8

	IEC	IEEE
a	199 mm	7.83"
b	100 mm	3.94"
c	72.9 mm	2.87"
e	19.8 mm	0.78"
f	41 mm	1.61"
g	41 mm	1.61"
h	27 mm	1.06"
d1	10.5 mm	3/4"
d2	14 mm	1/2"
l	152 mm	5.98"

## Insulating bracket options

### [P22] DIN insulating bracket for $U_r \leq 15$ kV

Order number spare part: for thread M12: 3EX4 086-1C

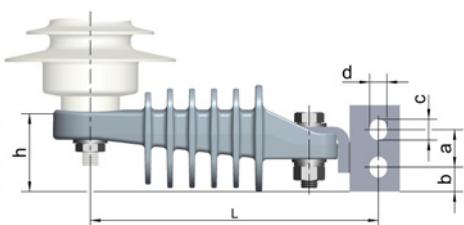

For surge arrester:

3EK7

	IEC	IEEE
a	26 mm	1.02"
b	17 mm	0.67"
c	14.5 mm	0.57"
d	12 mm	0.47"
h	54 mm	2.13"
l	156 mm	6.14"

### [P22] DIN insulating bracket for $U_r > 15$ kV

Order number spare part: for thread M12: 3EX4 086-2C

For surge arrester:

3EK7

	IEC	IEEE
a	26 mm	1.02"
b	17 mm	0.67"
c	14.5 mm	0.57"
d	12 mm	0.47"
h	54 mm	2.13"
l	200 mm	7.87"

## Disconnect options

Ground lead disconnectors operate after arrester failures, to avoid permanent ground faults in the network. Most disconnectors on the market contain explosive cartridges to operate the disconnector; these cartridges are considered as dangerous goods with certain risks (violent shattering, acoustic shock), and are strongly regulated in most countries. Siemens Energy disconnectors do not utilize any pyrotechnics – offering safe handling, storage and installation.

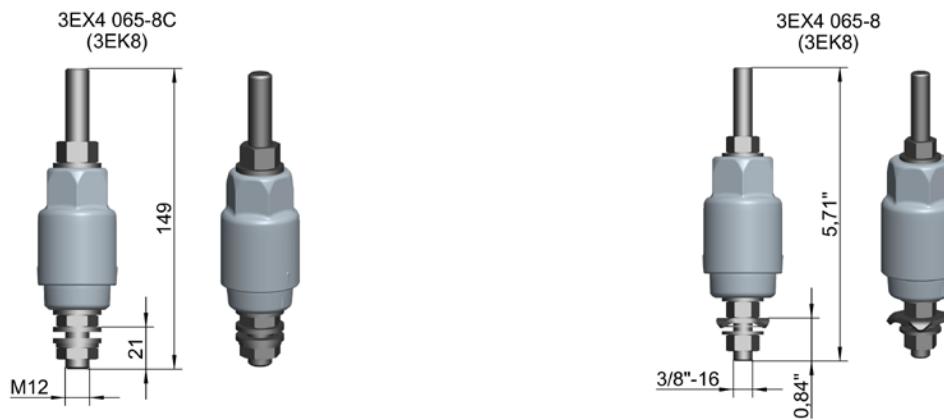

### Disconnector for surge arrester 3EK7

Order number spare part: for thread 3/8": 3EX4 065-7A / for thread M12: 3EX4 065-7C

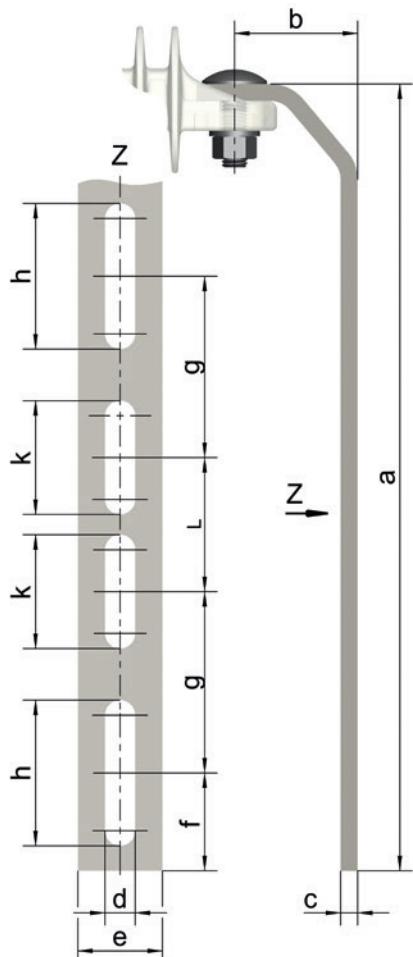

### Disconnector for surge arrester 3EK8

Order number spare part: for thread 3/8": 3EX4 065-8 / for thread M12: 3EX4 065-8C

## Mounting options

### Transformer bracket

**[Q11] 8.7 inch / 221 mm**

Order number spare part: 3EX4 075-0A

For surge arrester: 3EK7 and 3EK8

	IEC	IEEE
a	221 mm	8 5/8 "
b	60.5 mm	2 3/8 "
c	8 mm	0.32
d	14.3 mm	0.56"
e	40 mm	1.58"
f	41.4 mm	1 5/8 "
g	63.2 mm	2 1/2 "
h	57.2 mm	2 1/4 "

**[Q12] 11 inch / 279 mm**

Order number spare part: 3EX4 075-0C

For surge arrester: 3EK7 and 3EK8

	IEC	IEEE
a	279.4 mm	11"
b	60.5 mm	2 3/8 "
c	8 mm	0.32"
d	14.3 mm	0.56"

h	69 mm	2 3/4 "
k	53.9 mm	2 1/8 "
l	63.5 mm	2 1/2 "

**[Q51] Cross-arm bracket**

Order number spare part: 3EX4 073-0A

For surge arrester:

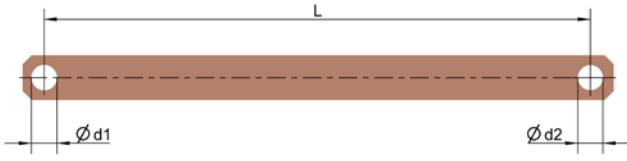

3EK7 and 3EK8

	IEC	IEEE
a	104.6 ... 150.9 mm	4.12" ... 5.94"
b	0 ... 120.6 mm	0" ... 4.75"
c	33 mm	1.30"
d	52 mm	2.05"
t	M10	M10

## Lead options

### [P52] Ground strap, 305 mm / 12 inch

Order number spare part: for thread 3/8": 3EX4 078-0A / for thread M12: 3EX4 078-0C

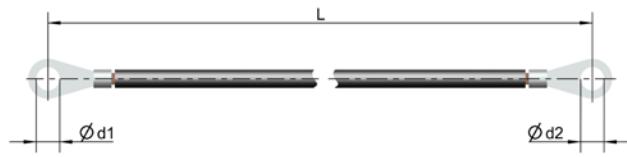

For surge arrester:

3EK7 and 3EK8

	IEC	IEEE
L	305 mm	12"
d1	14 mm	3/8"
d2	14 mm	1/2"

### [R51] Line and earth lead, insulated

Order number spare part: for thread 3/8": 3EX4 074-0A / for thread M12: 3EX4 074-0C

For surge arrester:

3EK7 and 3EK8

	IEC	IEEE
L	455 mm	17.9"
d1	13 mm	3/8"
d2	13 mm	1/2"

### [R61] Line and earth lead

Order number spare part: for thread 3/8": 3EX4 121-3A

For surge arrester:

3EK7 and 3EK8

	IEEE
d1	3/8"
d2	1"
I	12"

# 3EH4 medium-voltage surge arresters for distribution networks

The 3EH4 medium-voltage plug-in arrester optimally protects your transformers and switchgear (indoor & outdoor IP66) against switching overvoltages and lightning. Thanks to the alignment of the arrester's protection performance with the impulse withstand voltage of encapsulated switchgear and transformers, overvoltages generated by the reflection of traveling waves and switching operations are also limited.

Because it has the same electrical characteristics as Siemens Energy' 3EK medium-voltage surge arresters, the 3EH4 medium-voltage surge arrester also offers extremely reliable protection against overvoltages.

New versions with insulated ground terminal are available, enabling the use of monitoring devices.

## Rugged design for high power and a long life

The plug-and-socket connection is available in connector sizes 2 and 3 and is dimensioned to EN 50180 / EN 50181 for the inner cone system. The 3EH4 medium-voltage surge arrester corresponds to arrester class DH and is suitable for operating voltages up to 52.5 kV. Low residual voltages

guarantee superior insulation coordination and protection. The metal-oxide resistors (MOVs) are silicone-coated, providing insulation against the metal housing. A corresponding dimensioning ensures that the metal-oxide resistors have the requisite thermal stability. However, if the MOVs should be overloaded, the 3EH4 medium-voltage surge arrester provides a controlled reduction in pressure via a corrosion-resistant pressure-relief diaphragm.

The 3EH4 medium-voltage surge arrester protects personnel by means of a grounded, corrosion-resistant aluminum housing, making it touch-proof. Because it is hermetically sealed, the MOVs are also protected against moisture and other environmental influences.

## Development according to standards

The 3EH4 surge arrester complies with the IEC 60099-4 standard. The connector system was dimensioned according to the EN 50180 and EN 50181 standards. Type tests were performed in independent, PEHLA-accredited laboratories; the reports are available on request from your Siemens Energy contact.

Siemens Energy 3EH4 surge arresters are ideally suited for the reliable protection of:

- Switchgear protection
- Transformer protection

# 3EJ Surge arresters with high energy discharge capabilities

**Siemens Energy cage design 3EJ high energy discharge surge arresters offer superior protection against overvoltages in medium-voltage systems.**

The metal oxide resistors (MOV) are enclosed by a cage made of fiber-reinforced plastic (FRP) rods, providing a rigid, reinforced structure ensuring high mechanical strength.

Reliability is guaranteed by the direct molding of the silicone rubber onto the MOVs and the FRP rods. This ensures the total embedding of all components free of inclusions and gaps, thus providing an excellent sealing system, which avoids partial discharges or moisture ingress.

In the extremely rare event of the MOVs being overloaded, arcing cannot result in a buildup of critical internal pressure, since the MOVs are not enclosed in a sealed mechanical shell. The arc can escape directly through the soft silicone housing, leaving the mechanical support structure of the enclosure unharmed. The ejection of internal parts that could damage other equipment nearby is prevented almost completely. Siemens Energy' innovative cage design ensures outstanding performance in safety issues.

Silicone rubber is highly hydrophobic and maintains its ability to repel water and any deposits of pollution throughout its entire service life. This results in high tracking and erosion resistance. The silicone rubber housing is self-extinguishing and flame-retardant. These advantages provide maintenance-free and reliable service life for 3EJ surge arresters.

Siemens Energy 3EJ cage design surge arresters are ideally suited for the reliable protection of:

- Generators
- Motors
- Arc furnaces
- Arc furnace transformers
- Dry type transformers
- Airfield-lighting systems
- Cable sheath
- Capacitors and capacitor banks
- Converters for drives

Siemens Energy offers five product lines for the application with high energy discharge, which differentiate in the protection level:

- 3EJ2 – for rated voltages up to 54 kV, medium energy discharge capability.
- 3EJ3 – for rated voltages up to 54 kV, high energy discharge capability.
- 3EJ4 – for rated voltages up to 54 kV, very high energy discharge capability.
- 3EJ0 – for rated voltages up to 15 kV, very low protection levels for protection against switching over voltages.
- 3EJ9 – for rated voltages up to 12 kV, very low protection levels for protection against switching over voltages.

The proven 3EJ4 is also available in a version for indoor application, offering the same benefits as the version for outdoor application.

The 3EJ0 and 3EJ9 surge arresters have been optimized for the protection against overvoltages caused by switching in combination with very low protection levels. The 3EJ0 surge arresters are normally used in cable systems up to 15 kV. For station service systems of power stations and extensive cable systems the 3EJ9 surge arresters are used having a higher energy absorption capability and improved protection level.

# 3EP-G Porcelain surge arresters

**Siemens Energy 3EP porcelain-housed surge arresters ensure maximum protection in an overload situation thanks to a specially designed directional pressure relief device.**

In the case of an overload or the extremely rare case of an arrester short-circuit, the arc escapes easily through the pressure relief devices. No pressure is built up inside the arrester and no internal parts are ejected, which prevents damage to surrounding equipment.

For the overvoltage protection of generators and motors, which require a very high short-circuit current capability, Siemens Energy offers the **3EP-G** porcelain housed surge arresters with short-circuit current capability up to 300 kA.

The excellent sealing system of 3EP-G surge arresters prevents failures or moisture ingress and guarantees decades of trouble-free service. The use of nonporous sulfur

cement instead of corrosive Portland cement for bonding protects the MO resistors and prevents aging effects.

The MO resistors of 3EP-G surge arresters are enclosed by a rigid, reinforced cage made of FRP rods. The high tensile strength of the FRP rods is used to hold the arrester's MO resistors in place tightly.

## 3EP-G specifications according to IEC 60099-4 standard

Rated voltage $U_r$ kV	Continuous operating voltage $U_c$ kV	Arrester type	Electrical Characteristics				Maximum values of the residual voltages at discharge currents of the following impulses

## How to order

### 3EP-G IEC

#### Example 3EP3 030-2GA31-2ZA9-Z K83 P2G R2G

3EP3	... Tube design porcelain housing, heavy
007-2	... Rated voltage = 7.2 kV
030	... Rated voltage = 30 kV
-2	... Resistor type
G	... Generator protection
A	... Housing type (H=665 mm)
3	... Energy class $W_{th} = 7 \text{ kJ/kV}_r$
1	... 1 unit
-2	... Alternating sheds
Z	... Special high-voltage terminal (see below)
A	... Nameplate (German/English)
9	... Special mounting (see below)
K83	... Enhanced short-circuit performance 300 kA
P2G	... Terminal plate 13 mm for 300 kA
R2G	... Insulated mounting 300 kA

## Dimensions 3EP3-G IEC

## Packing dimensions 3EP-G

Single packing									
Arrester type	Housing	Length mm	Length inch	Width mm	Width inch	Height mm	Height inch		
3EP-G	3EP3-G, housing A	80	3.1	80	3.1	130	5.1		

Triple packing									
Arrester type	Housing	Length mm	Length inch	Width mm	Width inch	Height mm	Height inch		
3EP-G	3EP3-G, housing A	150	5.9	80	3.1	130	5.1		

# Glossary

## **Continuous operating voltage (symbol $U_c$ )**

indicates the designated permissible root mean square value of the power frequency voltage that is allowed to be applied continuously between the arrester terminals.

## **Creepage distance**

defines the distance between the metal end fittings, measured along the housing surface. It is an important factor in the behavior of an insulator – or a device containing an insulator – in polluted conditions.

## **Discharge voltage**

quantifies the voltage drop between the arrester's terminals when a current impulse is injected. For current impulses in the shape and value of a standard test current impulse (lightning current impulse, switching current impulse, steep current impulse), the simultaneously occurring residual voltages define the protective levels that are assigned to this current shape and value.

## **Duty cycle voltage (symbol $U_d$ )**

is the maximum permissible root mean square value of the power frequency voltage between the arrester terminals at which the arrester is designed to operate correctly under temporary overvoltage conditions as the operating duty tests. Normally, the manufacturer specifies whether it can be applied to the arrester for a duration of 10 seconds (which corresponds to the value in the operating duty test) or 100 seconds. The rated voltage is the reference parameter for determining the operating characteristics.

## **Highest voltage of a system (symbol $U_s$ )**

indicates the root mean square value of the highest phase-to-phase operating voltage that occurs under normal operating conditions at any time and at any point in the system.

## **Leakage distance**

defines the distance between the metal end fittings, measured along the housing surface. It is an important factor in the behavior of an insulator – or a device containing an insulator – in polluted conditions.

## **Lightning impulse classifying current (symbol $I_n$ )**

indicates the peak value of a lightning current impulse used to classify an arrester.

## **Maximum Continuous Operating Voltage (MCOV)**

indicates the designated permissible root mean square value of the power frequency voltage that is allowed to be applied continuously between the arrester terminals.

## **Nominal discharge current (symbol $I_n$ )**

indicates the peak value of a lightning current impulse used to classify an arrester.

## **Protective level**

is the maximum value of an arrester's residual voltage at a standard current impulse. In this case, there is a difference between the lightning impulse protective level (8/20  $\mu$ s), the switching impulse protective level (30/60  $\mu$ s), and the steep current impulse (1/2 $\mu$ s) protective level.

## **Rated short-circuit current (symbol $I_s$ )**

indicates the root mean square value of the symmetrical highest short-circuit current that can flow after an arrester has been overloaded without causing violent shattering of the housing.

## **Rated voltage (symbol $U_r$ )**

is the maximum permissible root mean square value of the power frequency voltage between the arrester terminals at which the arrester is designed to operate correctly under temporary overvoltage conditions as the operating duty tests. Normally, the manufacturer specifies whether it can be applied to the arrester for a duration of 10 seconds (which corresponds to the value in the operating duty test) or 100 seconds. The rated voltage is the reference parameter for determining the operating characteristics.

## **Residual voltage**

quantifies the voltage drop between the arrester's terminals when a current impulse is injected. For current impulses in the shape and value of a standard test current impulse (lightning current impulse, switching current impulse, steep current impulse), the simultaneously occurring residual voltages define the protective levels that are assigned to this current shape and value.

## **Specific creepage distance (SCD)**

is the creepage distance of an insulator in relation to the highest voltage for the equipment,  $U_s$  (phase-to-phase voltage), given in mm/kV.

## **Temporary overvoltage (TOV)**

denominates the power frequency overvoltage that can occur for a duration of several tenths of a second to up to a few seconds, as a result of a switching operation or system failure. Its value depends on the type of neutral earthing in the system.
